LIST OF Antenna Lab. EXPERIMENTs

Experiment 1: Quick Review For Electromagnetic Concepts Moving student from circuit and electronic lab stage into microwave lab and Making memory refresh for electromagnetic concept.
Experiment 2: Waveguide Kit Familiarization General description about waveguide Kit (mod. MW-B-C/EV): electronic component, passive component, accessories, antennas, reflection and parabolic system.
Experiment 3: Measurement Of Frequency & Wave-Length Measure wavelength with slotted line, measure wavelength in guide and free space and to point to relation between frequency and wavelength frequency.
Experiment 4: Measurements Of Power And Attenuation Operation of waveguide attenuator, power measurement and to measure the power loss introduced by waveguide component.
Experiment 5: Measurements Of VSWR And Impedance Using slotted line to measure VSWR, observing how load impedance effects on VSWR, and to determine when load is properly matched.
Experiment 6: horn Antennas Describing the characteristic of horn antenna and carry out gain measurement and radiation.
xperiment 7: Parabolic Antenna Describing the characteristic of parabolic antenna and carry out gain measurement and radiation.
Experiment 8: Impedance Calculation And Matching Using smith chart to measure unknown impedance and using E-H tuner for matching.
