Lab 4

Control Flow - Branching and Jumps

Class Exercise (15 min): Campus Coffee Kiosk

Goal: Use a switch for drink choice and if/else for size and (optional) student discount.

Scenario

You're coding a mini **coffee kiosk**. The cashier selects a drink, the customer picks a size, and (optionally) a **student discount** is applied.

Rules

Drinks (choose with menu → `switch`):

1. Americano — base RM 5.00
2. Latte — base RM 6.50
3. Tea — base RM 4.00
4. Exit

Size (choose with char → `if/else`):

- `S` → + RM 0.00
- `M` → + RM 1.00
- `L` → + RM 2.00

Student discount (use `if/else`): (Optional)

- `Y`/`y` → 10% off the subtotal
- `N`/`n` → no discount

Validation: drink ∈ {1,2,3,4}, size ∈ {S,M,L}, discount flag ∈ {Y,N} (case-insensitive)

Guidance

- Pick **drink** with numbers → handled by `switch`.
- Pick **size** `S/M/L` → handled by `if/else`.
- **Discount is optional:** prompt `Apply student discount? (Y/N)`; only apply 10% if user enters `Y`/`y`. Any other input = **no discount** (no re-prompt).
    - Validate quickly and print a receipt.
