Assignment 3

Write an assembly program for a simple calculator that can handle the common function such as (+, -, /, ×), you need to put an option so that the user can choose to have binary calculator or decimal. The calculator should be able to handle common errors in both binary and decimal and show to user by message (for example, “overflow happen, 0/any number and infinity”).
You may need to define few prompts for the user so that it can be chosen and then the value can be loaded in the registers to be used later in calculation.
For the code, each like has to be explained by “#” sign and please put clear explanation or justification.
You need to run the code and each stage please snapshot and attach all of them in one PDF file. The “.ASM” file need to be uploaded as well.

(Hint: Some of suggestion prompts:

```
prompt1: .asciiz "Choose binary or decimal calculator: "

prompt2: .asciiz "Enter first number: "

prompt3: .asciiz "Enter second number: "

prompt4: .asciiz "Enter operation (+, -, *, /): "

result: .asciiz "Result: "

error: .asciiz "Invalid operation entered. Exiting program.\n")
```

This assignment will be checked to do not use the ChatGPT.
